this book presents the fundamental notions and advanced mathematical tools in the stochastic modeling of uncertainties and their quantification for large scale computational models in sciences and engineering in particular it focuses in parametric

uncertainties and non parametric uncertainties with applications from the structural dynamics and vibroacoustics of complex mechanical systems from micromechanics and multiscale mechanics of heterogeneous materials resulting from a course developed by the author the book begins with a description of the fundamental mathematical tools of probability and statistics that are directly useful for uncertainty quantification it proceeds with a well carried out description of some basic and advanced methods for constructing stochastic models of uncertainties paying particular attention to the problem of calibrating and identifying a stochastic model of uncertainty when experimental data is available this book is intended to be a graduate level textbook for students as well as professionals interested in the theory computation and applications of risk and prediction in science and engineering fields

this advanced text focuses on the uses of distance sampling to estimate the density and abundance of biological populations it addresses new methodologies new technologies and recent developments in statistical theory and is the follow up companion to introduction to distance sampling oup 2001 in this text a general theoretical basis is established for methods of estimating animal abundance from sightings surveys and a wide range of approaches to analysis of sightings data is explored these approaches include modelling animal detectability as a function of covariates where the effects of habitat observer weather etc on detectability can be assessed estimating animal density as a function of location allowing for example animal density to be related to habitat and other locational covariates estimating change over time in populations a necessary aspect of any monitoring programme estimation when detection of animals on the line or at the point is uncertain as often occurs for marine populations or when the survey region has dense cover survey design and automated design algorithms allowing rapid generation of sound survey designs using geographic information systems adaptive distance sampling methods which concentrate survey effort in areas of high animal density passive distance sampling methods which extend the application of distance sampling to species that cannot be readily detected in sightings surveys but can be trapped and testing of methods by simulation so that performance of the approach in varying circumstances can be assessed authored by a leading team this text is aimed at professionals in government and environment agencies statisticians biologists wildlife managers conservation biologists and ecologists as well as graduate students studying the density and abundance of biological populations
